

Scan Report

February 7, 2026

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone “Coordinated Universal Time”, which is abbreviated “UTC”. The task was “Week2-Unauthenticated-Scan ”. The scan started at Mon Jan 26 06:56:35 2026 UTC and ended at Mon Jan 26 07:30:44 2026 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

Contents

2.4.3	Low general/tcp	124

1 Result Overview

Host	Critical	High	Medium	Low	Log	False P.
192.168.186.129	14	10	40	6	0	0
192.168.186.1	0	0	2	1	0	0
192.168.186.128	0	0	1	0	0	0
192.168.186.130	0	0	1	2	0	0
Total: 4	14	10	44	9	0	0

Vendor security updates are not trusted.

Overrides are off. Even when a result has an override, this report uses the actual threat of the result.

Information on overrides is included in the report.

Notes are included in the report.

This report might not show details of all issues that were found.

Issues with the threat level “Log” are not shown.

Issues with the threat level “Debug” are not shown.

Issues with the threat level “False Positive” are not shown.

Only results with a minimum QoD of 70 are shown.

This report contains all 77 results selected by the filtering described above. Before filtering there were 743 results.

[return to 192.168.186.129]

2.1.6 Critical 8787/tcp

Critical (CVSS: 10.0)
NVT: Distributed Ruby (dRuby/DRb) Multiple RCE Vulnerabilities
Summary Systems using Distributed Ruby (dRuby/DRb), which is available in Ruby versions 1.6 and later, may permit unauthorized systems to execute distributed commands.
Quality of Detection (QoD): 99%
Vulnerability Detection Result The service is running in <code>\$SAFE >= 1</code> mode. However it is still possible to run arbitrary syscall commands on the remote host. Sending an invalid syscall the service returned the following response: <code>Flo::Errno::ENOSYS:bt["3/usr/lib/ruby/1.8/drbs/drbs.rb:1555:in 'syscall'"0/usr/lib/ruby/1.8/drbs/drbs.rb:1555:in 'send'"4/usr/lib/ruby/1.8/drbs/drbs.rb:1555:in '__send__'"A/usr/lib/ruby/1.8/drbs/drbs.rb:1555:in 'perform_without_block'"3/usr/lib/ruby/1.8/drbs/drbs.rb:1515:in 'perform'"5/usr/lib/ruby/1.8/drbs/drbs.rb:1589:in 'main_loop'"0/usr/lib/ruby/1.8/drbs/drbs.rb:1585:in 'loop'"5/usr/lib/ruby/1.8/drbs/drbs.rb:1585:in 'main_loop'"1/usr/lib/ruby/1.8/drbs/drbs.rb:1581:in 'start'"5/usr/lib/ruby/1.8/drbs/drbs.rb:1581:in 'main_loop'"/usr/lib/ruby/1.8/drbs/drbs.rb:143:in 'run'"1/usr/lib/ruby/1.8/drbs/drbs.rb:1427:in 'start'"//usr/lib/ruby/1.8/drbs/drbs.rb:1427:in 'run'"6/usr/lib/ruby/1.8/drbs/drbs.rb:1347:in 'initialize'"//usr/lib/ruby/1.8/drbs/drbs.rb:1627:in 'new'"9/usr/lib/ruby/1.8/drbs/drbs.rb:1627:in ... continues on next page ...</code>

<p style="text-align: right;">... continued from previous page ...</p> <pre>→'start_service'"%/usr/sbin/druby_timeserver.rb:12:errnoi+:mesg"Function not im →plemented</pre>
<p>Impact</p> <p>By default, Distributed Ruby does not impose restrictions on allowed hosts or set the \$SAFE environment variable to prevent privileged activities. If other controls are not in place, especially if the Distributed Ruby process runs with elevated privileges, an attacker could execute arbitrary system commands or Ruby scripts on the Distributed Ruby server. An attacker may need to know only the URI of the listening Distributed Ruby server to submit Ruby commands.</p>
<p>Solution:</p> <p>Solution type: Mitigation</p> <p>Administrators of environments that rely on Distributed Ruby should ensure that appropriate controls are in place. Code-level controls may include:</p> <ul style="list-style-type: none"> - Implementing taint on untrusted input - Setting \$SAFE levels appropriately (>=2 is recommended if untrusted hosts are allowed to submit Ruby commands, and >=3 may be appropriate) - Including drb/acl.rb to set ACLEntry to restrict access to trusted hosts
<p>Vulnerability Detection Method</p> <p>Send a crafted command to the service and check for a remote command execution via the instance_eval or syscall requests.</p> <p>Details: Distributed Ruby (dRuby/DRb) Multiple RCE Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.108010 Version used: 2024-06-28T05:05:33Z</p>
<p>References</p> <p>url: https://tools.cisco.com/security/center/viewAlert.x?alertId=22750 url: http://www.securityfocus.com/bid/47071 url: http://blog.recurity-labs.com/archives/2011/05/12/druby_for_penetration_tes ters/ url: http://www.ruby-doc.org/stdlib-1.9.3/libdoc/druby/rdoc/DRb.html</p>

2.1.7 Critical 3306/tcp

Critical (CVSS: 9.8)
NVT: MySQL / MariaDB Default Credentials (MySQL Protocol)
Product detection result
cpe:/a:mysql:mysql:5.0.51a Detected by MariaDB / Oracle MySQL Detection (MySQL Protocol) (OID: 1.3.6.1.4.1. ... continues on next page ...

	... continued from previous page ...
→25623.1.0.100152)	
Summary	
It was possible to login into the remote MySQL using default credentials.	
Quality of Detection (QoD): 95%	
Vulnerability Detection Result	
It was possible to login as user "root" with an empty password.	
Solution:	
Solution type: Mitigation	
- Change the password as soon as possible	
- Contact the vendor for other possible fixes / updates	
Affected Software/OS	
The following products are known to use such weak credentials:	
- CVE-2001-0645: Symantec/AXENT NetProwler 3.5.x	
- CVE-2002-1809: Windows binary release of MySQL 3.23.2 through 3.23.52	
- CVE-2004-1532: AppServ 2.5.x and earlier	
- CVE-2004-2357: Proofpoint Protection Server	
- CVE-2006-1451: MySQL Manager in Apple Mac OS X 10.3.9 and 10.4.6	
- CVE-2007-2554: Associated Press (AP) Newspower 4.0.1 and earlier	
- CVE-2007-6081: AdventNet EventLog Analyzer build 4030	
- CVE-2009-0919: XAMPP	
- CVE-2014-3419: Infoblox NetMRI before 6.8.5	
- CVE-2015-4669: Xsuite 2.x	
- CVE-2016-6531, CVE-2018-15719: Open Dental before version 18.4	
- CVE-2024-22901: Vinchin Backup & Recovery 7.2 and prior	
Other products might be affected as well.	
Vulnerability Detection Method	
Details: MySQL / MariaDB Default Credentials (MySQL Protocol)

2.1.8 Critical 1524/tcp

Critical (CVSS: 10.0)

NVT: Possible Backdoor: Ingreslock

Summary

A backdoor is installed on the remote host.

Quality of Detection (QoD): 99%

Vulnerability Detection Result

The service is answering to an 'id;' command with the following response: uid=0(→root) gid=0(root)

Impact

Attackers can exploit this issue to execute arbitrary commands in the context of the application. Successful attacks will compromise the affected system.

Solution:

Solution type: Workaround

A whole cleanup of the infected system is recommended.

Vulnerability Detection Method

Details: Possible Backdoor: Ingreslock

OID:1.3.6.1.4.1.25623.1.0.103549

Version used: 2023-07-25T05:05:58Z

[[return to 192.168.186.129](#)]

2.1.9 Critical 5900/tcp

Critical (CVSS: 9.0)
NVT: VNC Brute Force Login
Summary Try to log in with given passwords via VNC protocol.
Quality of Detection (QoD): 95%
Vulnerability Detection Result It was possible to connect to the VNC server with the password: password
Solution: Solution type: Mitigation Change the password to something hard to guess or enable password protection at all.
Vulnerability Insight This script tries to authenticate to a VNC server with the passwords set in the password preference. It will also test and report if no authentication / password is required at all. Note: Some VNC servers have a blacklisting scheme that blocks IP addresses after five unsuccessful connection attempts for a period of time. The script will abort the brute force attack if it encounters that it gets blocked. Note as well that passwords can be max. 8 characters long.
Vulnerability Detection Method Details: VNC Brute Force Login OID:1.3.6.1.4.1.25623.1.0.106056 Version used: 2021-07-23T07:56:26Z

[[return to 192.168.186.129](#)]

2.1.10 Critical general/tcp

Critical (CVSS: 10.0)
NVT: Operating System (OS) End of Life (EOL) Detection
Product detection result cpe:/o:canonical:ubuntu_linux:8.04 Detected by OS Detection Consolidation and Reporting (OID: 1.3.6.1.4.1.25623.1.0 →.105937)
... continues on next page ...

... continued from previous page ...

Summary

The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 80%**Vulnerability Detection Result**

The "Ubuntu" Operating System on the remote host has reached the end of life.

CPE: cpe:/o:canonical:ubuntu_linux:8.04

Installed version,

build or SP: 8.04

EOL date: 2013-05-09

EOL info: <https://documentation.ubuntu.com/project/release-team/list-of-releases/>

Impact

An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: Mitigation

Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor.

Note / Important: Please create an override for this result if the target host is a:

- Windows system with Extended Security Updates (ESU)
- System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar

Vulnerability Detection Method

Checks if an EOL version of an OS is present on the target host.

Details: Operating System (OS) End of Life (EOL) Detection

2.1.12 Critical 512/tcp

Critical (CVSS: 10.0)

NVT: The rexec service is running

Summary

This remote host is running a rexec service.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

The rexec service was detected on the target system.

Solution:

Solution type: Mitigation

Disable the rexec service and use alternatives like SSH instead.

Vulnerability Insight

rexec (remote execution client for an exec server) has the same kind of functionality that rsh has: you can execute shell commands on a remote computer.

The main difference is that rexec authenticate by reading the username and password *unencrypted* from the socket.

Vulnerability Detection Method

Checks whether an rexec service is exposed on the target host.

Details: The rexec service is running

2.1.13 Critical 80/tcp

Critical (CVSS: 10.0) NVT: TWiki < 4.2.4 Multiple XSS / Command Execution Vulnerabilities
Summary TWiki is prone to multiple cross-site scripting (XSS) and command execution vulnerabilities.
Quality of Detection (QoD): 80%
Vulnerability Detection Result Installed version: 01.Feb.2003 Fixed version: 4.2.4
Impact Successful exploitation could allow execution of arbitrary script code or commands. This could let attackers steal cookie-based authentication credentials or compromise the affected application.
Solution: Solution type: VendorFix Update to version 4.2.4 or later.
Affected Software/OS TWiki versions prior to 4.2.4.
Vulnerability Insight The flaws are due to: - %URLPARAM% variable is not properly sanitized which lets attackers conduct cross-site scripting attack. - %SEARCH% variable is not properly sanitised before being used in an eval() call which lets the attackers execute perl code through eval injection attack.
Vulnerability Detection Method Details: TWiki < 4.2.4 Multiple XSS / Command Execution Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.800320 Version used: 2025-12-11T05:46:19Z

--

<h3>Impact</h3>

<p>Exploiting this issue allows remote attackers to view the source code of files in the context of the server process. This may allow the attacker to obtain sensitive information and to run arbitrary PHP code on the affected computer. Other attacks are also possible.</p>
--

<h3>Solution:</h3>

<p>Solution type: VendorFix</p>
--

<p>PHP: Update to version 5.3.13, 5.4.3 or later</p>
--

<p>- Other products / applications: Please contact the vendor for a solution</p>
--

<p>... continues on next page ...</p>

... continued from previous page ...

Affected Software/OS

PHP versions prior to 5.3.13 and 5.4.x prior to 5.4.3.

Other products / applications might be affected by the tested CVE-2012-1823 as well.

Vulnerability Insight

When PHP is used in a CGI-based setup (such as Apache's mod_cgid), the php-cgi receives a processed query string parameter as command line arguments which allows command-line switches, such as -s, -d or -c to be passed to the php-cgi binary, which can be exploited to disclose source code and obtain arbitrary code execution.

An example of the -s command, allowing an attacker to view the source code of index.php is below:

<http://example.com/index.php?-s>

Vulnerability Detection Method

Send multiple a crafted HTTP POST requests and checks the responses.

Notes:

- This script checks for the presence of CVE-2012-1823 which indicates that the system is also affected by the other included CVES.
- It is currently expected that a result of this VT is reported if the system is generally exposing a phpinfo() output on the relevant URL / endpoint (independent from the running product). Exposing such sensitive information is generally seen as a security misconfiguration and should be avoided.

Details: PHP < 5.3.13, 5.4.x < 5.4.3 Multiple Vulnerabilities - Active Check

2.1.14 High 21/tcp

High (CVSS: 7.5)

NVT: FTP Brute Force Logins With Default Credentials Reporting

Summary

It was possible to login into the remote FTP server using weak/known credentials.

Quality of Detection (QoD): 95%

Vulnerability Detection Result

It was possible to login with the following credentials <User>:<Password>
 msfadmin:msfadmin
 postgres:postgres
 service:service
 user:user

Impact

This issue may be exploited by a remote attacker to e.g. gain access to sensitive information or modify system configuration.

Solution:

Solution type: Mitigation

Change the password as soon as possible.

Vulnerability Insight

The following devices / software is known to be affected:

- CVE-2001-1594: Codonics printer FTP service as used in GE Healthcare eNTEGRA P&R
- CVE-2013-7404: GE Healthcare Discovery NM 750b
- CVE-2014-9198: Schneider Electric ETG3000 FactoryCast HMI gateways
- CVE-2015-7261: QNAP iArtist Lite distributed with QNAP Signage Station
- CVE-2016-8731: Foscam C1 devices
- CVE-2017-8218: vsftpd on TP-Link C2 and C20i devices
- CVE-2018-9068: IMM2 for IBM and Lenovo System x
- CVE-2018-17771: Ingenico Telium 2 PoS terminals
- CVE-2018-19063, CVE-2018-19064: Foscam C2 and Opticam i5 devices
- CVE-2018-25147: Microhard Systems IPn4G
- CVE-2020-36915: Adtec Digital SignEdje Digital Signage Player

Note: As the VT 'FTP Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108717) might run into a timeout the actual reporting of this vulnerability takes place in this VT instead.

Vulnerability Detection Method

Reports weak/known credentials detected by the VT 'FTP Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108717).

Details: [FTP Brute Force Logins With Default Credentials Reporting](#)

2.1.15 High 514/tcp

High (CVSS: 7.5)
NVT: rsh Unencrypted Cleartext Login
Summary This remote host is running a rsh service.
Quality of Detection (QoD): 80%
Vulnerability Detection Result The rsh service is misconfigured so it is allowing connections without a password or with default root:root credentials.
Solution: Solution type: Mitigation Disable the rsh service and use alternatives like SSH instead.
Vulnerability Insight rsh (remote shell) is a command line computer program which can execute shell commands as another user, and on another computer across a computer network. Remark: NIST don't see 'configuration issues' as software flaws so the referenced CVE has a severity of 0.0. The severity of this VT has been raised by Greenbone to still report a configuration issue on the target.
Vulnerability Detection Method Details: rsh Unencrypted Cleartext Login OID:1.3.6.1.4.1.25623.1.0.100080 Version used: 2021-10-20T09:03:29Z

2.1.16 High 5432/tcp

High (CVSS: 7.4)
NVT: SSL/TLS: OpenSSL CCS Man in the Middle Security Bypass Vulnerability
Summary OpenSSL is prone to a security bypass vulnerability.
Quality of Detection (QoD): 70%
... continues on next page ...

	... continued from previous page ...
Vulnerability Detection Result Vulnerability was detected according to the Vulnerability Detection Method.	
Impact Successfully exploiting this issue may allow attackers to obtain sensitive information by conducting a man-in-the-middle attack. This may lead to other attacks.	
Solution: Solution type: VendorFix Updates are available. Please see the references for more information.	
Affected Software/OS OpenSSL before 0.9.8za, 1.0.0 before 1.0.0m and 1.0.1 before 1.0.1h.	
Vulnerability Insight OpenSSL does not properly restrict processing of ChangeCipherSpec messages, which allows man-in-the-middle attackers to trigger use of a zero-length master key in certain OpenSSL-to-OpenSSL communications, and consequently hijack sessions or obtain sensitive information, via a crafted TLS handshake, aka the 'CCS Injection' vulnerability.	
Vulnerability Detection Method Send two SSL ChangeCipherSpec request and check the response. Details: SSL/TLS: OpenSSL CCS Man in the Middle Security Bypass Vulnerability OID:1.3.6.1.4.1.25623.1.0.105042 Version used: 2025-01-17T15:39:18Z

2.1.17 High 1099/tcp

High (CVSS: 7.5)

NVT: Java RMI Server Insecure Default Configuration RCE Vulnerability - Active Check

Summary

... continues on next page ...

<p>... continued from previous page ...</p> <p>Multiple Java products that implement the RMI Server contain a vulnerability that could allow an unauthenticated, remote attacker to execute arbitrary code (remote code execution/RCE) on a targeted system with elevated privileges.</p> <p>Quality of Detection (QoD): 95%</p> <p>Vulnerability Detection Result By doing an RMI request it was possible to trigger the vulnerability and make the remote host sending a request back to the scanner host (Details on the received packet follows). Destination IP: 192.168.186.128 (receiving IP on scanner host side) Destination port: 30450/tcp (receiving port on scanner host side) Originating IP: 192.168.186.129 (originating IP from target host side)</p> <p>Impact An unauthenticated, remote attacker could exploit the vulnerability by transmitting crafted packets to the affected software. When the packets are processed, the attacker could execute arbitrary code on the system with elevated privileges.</p> <p>Solution: Solution type: Workaround Disable class-loading. Please contact the vendor of the affected system for additional guidance.</p> <p>Vulnerability Insight The vulnerability exists because of an incorrect default configuration of the Remote Method Invocation (RMI) Server in the affected software.</p> <p>Vulnerability Detection Method Sends a crafted JRMI request and checks if the target is connecting back to the scanner host. Note: For a successful detection of this flaw the target host needs to be able to reach the scanner host on a TCP port randomly generated during the runtime of the VT (currently in the range of 10000-32000). Details: Java RMI Server Insecure Default Configuration RCE Vulnerability - Active Check OID:1.3.6.1.4.1.25623.1.0.140051 Version used: 2025-04-11T15:45:04Z</p> <p>References cve: CVE-2011-3556 url: https://web.archive.org/web/20211208040855/http://www.securitytracker.com/id?1026215 url: https://web.archive.org/web/20110824060234/http://download.oracle.com/java/1.3/docs/guide/rmi/spec/rmi-protocol.html url: https://tools.cisco.com/security/center/viewAlert.x?alertId=23665 dfn-cert: DFN-CERT-2012-1829 dfn-cert: DFN-CERT-2012-1380 dfn-cert: DFN-CERT-2012-1377</p>

2.1.22 Medium 21/tcp

Medium (CVSS: 6.4)

NVT: Anonymous FTP Login Reporting

Summary

Reports if the remote FTP Server allows anonymous logins.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

It was possible to login to the remote FTP service with the following anonymous account(s):

anonymous:anonymous@example.com
ftp:anonymous@example.com

Impact

Based on the files accessible via this anonymous FTP login and the permissions of this account an attacker might be able to:

- gain access to sensitive files
- upload or delete files.

Solution:

Solution type: Mitigation

If you do not want to share files, you should disable anonymous logins.

... continues on next page ...

... continued from previous page ...
<p>Vulnerability Insight A host that provides an FTP service may additionally provide Anonymous FTP access as well. Under this arrangement, users do not strictly need an account on the host. Instead the user typically enters 'anonymous' or 'ftp' when prompted for username. Although users are commonly asked to send their email address as their password, little to no verification is actually performed on the supplied data. Remark: NIST don't see 'configuration issues' as software flaws so the referenced CVE has a severity of 0.0. The severity of this VT has been raised by Greenbone to still report a configuration issue on the target.</p>
<p>Vulnerability Detection Method Details: Anonymous FTP Login Reporting OID:1.3.6.1.4.1.25623.1.0.900600 Version used: 2021-10-20T09:03:29Z</p>
<p>References cve: CVE-1999-0497</p>

Medium (CVSS: 4.8) NVT: FTP Unencrypted Cleartext Login
<p>Summary The remote host is running a FTP service that allows cleartext logins over unencrypted connections.</p>
<p>Quality of Detection (QoD): 70%</p>
<p>Vulnerability Detection Result The remote FTP service accepts logins without a previous sent 'AUTH TLS' command →. Response(s): Non-anonymous sessions: 331 Please specify the password. Anonymous sessions: 331 Please specify the password.</p>
<p>Impact An attacker can uncover login names and passwords by sniffing traffic to the FTP service.</p>
<p>Solution: Solution type: Mitigation Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.</p>
<p>Vulnerability Detection Method</p>
... continues on next page ...

... continued from previous page ...

Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command.

Details: FTP Unencrypted Cleartext Login

OID:1.3.6.1.4.1.25623.1.0.108528

Version used: 2023-12-20T05:05:58Z

[[return to 192.168.186.129](#)]

2.1.23 Medium 5432/tcp

Medium (CVSS: 5.9)

NVT: SSL/TLS: Report Weak Cipher Suites

Product detection result

cpe:/a:ietf:transport_layer_security

Detected by SSL/TLS: Report Supported Cipher Suites (OID: 1.3.6.1.4.1.25623.1.0.←802067)

Summary

This routine reports all weak SSL/TLS cipher suites accepted by a service.

Quality of Detection (QoD): 98%

Vulnerability Detection Result

'Weak' cipher suites accepted by this service via the SSLv3 protocol:

TLS_RSA_WITH_RC4_128_SHA

'Weak' cipher suites accepted by this service via the TLSv1.0 protocol:

TLS_RSA_WITH_RC4_128_SHA

Impact

This could allow remote attackers to obtain sensitive information or have other, unspecified impacts.

Solution:

Solution type: Mitigation

The configuration of this services should be changed so that it does not accept the listed weak cipher suites anymore.

Please see the references for more resources supporting you with this task.

Affected Software/OS

All services providing an encrypted communication using weak SSL/TLS cipher suites.

... continues on next page ...

... continued from previous page ...

Vulnerability Insight

These rules are applied for the evaluation of the cryptographic strength:

- RC4 is considered to be weak (CVE-2013-2566, CVE-2015-2808)
- Ciphers using 64 bit or less are considered to be vulnerable to brute force methods and therefore considered as weak (CVE-2015-4000)
- 1024 bit RSA authentication is considered to be insecure and therefore as weak
- Any cipher considered to be secure for only the next 10 years is considered as medium
- Any other cipher is considered as strong

Vulnerability Detection Method

Checks previous collected cipher suites.

NOTE: No severity for SMTP services with 'Opportunistic TLS' and weak cipher suites on port 25/tcp is reported. If too strong cipher suites are configured for this service the alternative would be to fall back to an even more insecure cleartext communication.

Details: SSL/TLS: Report Weak Cipher Suites

Medium (CVSS: 5.9) NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection
Product detection result cpe:/a:ietf:transport_layer_security:1.0 Detected by SSL/TLS: Version Detection (OID: 1.3.6.1.4.1.25623.1.0.105782)
Summary It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.
Quality of Detection (QoD): 98%
Vulnerability Detection Result In addition to TLSv1.0+ the service is also providing the deprecated SSLv3 protocol and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.8020 →67) VT.
Impact An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection. Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.
Solution: Solution type: Mitigation It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols. Please see the references for more resources supporting you with this task.
Affected Software/OS All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.
Vulnerability Insight The SSLv2 and SSLv3 protocols contain known cryptographic flaws like: - CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE) - CVE-2016-0800: Decrypting RSA with Obsolete and Weakened encryption (DROWN)
Vulnerability Detection Method Checks the used SSL protocols of the services provided by this system. Details: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection OID: 1.3.6.1.4.1.25623.1.0.111012

Medium (CVSS: 5.0) NVT: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)
Summary The remote SSL/TLS service is prone to a denial of service (DoS) vulnerability.
Quality of Detection (QoD): 70%
Vulnerability Detection Result ... continues on next page ...

... continued from previous page ...	
<p>The following indicates that the remote SSL/TLS service is affected:</p> <p>Protocol Version Successful re-done SSL/TLS handshakes (Renegotiation) over an → existing / already established SSL/TLS connection</p> <hr/> <p>→</p> <p>TLSv1.0 10</p>	
<p>Impact</p> <p>The flaw might make it easier for remote attackers to cause a DoS (CPU consumption) by performing many renegotiations within a single connection.</p>	
<p>Solution:</p> <p>Solution type: VendorFix</p> <p>Users should contact their vendors for specific patch information.</p> <p>A general solution is to remove/disable renegotiation capabilities altogether from/in the affected SSL/TLS service.</p>	
<p>Affected Software/OS</p> <p>Every SSL/TLS service which does not properly restrict client-initiated renegotiation.</p>	
<p>Vulnerability Insight</p> <p>The flaw exists because the remote SSL/TLS service does not properly restrict client-initiated renegotiation within the SSL and TLS protocols.</p> <p>Note: The referenced CVEs are affecting OpenSSL and Mozilla Network Security Services (NSS) but both are in a DISPUTED state with the following rationale:</p> <ul style="list-style-type: none"> > It can also be argued that it is the responsibility of server deployments, not a security library, to prevent or limit renegotiation when it is inappropriate within a specific environment. <p>Both CVEs are still kept in this VT as a reference to the origin of this flaw.</p>	
<p>Vulnerability Detection Method</p> <p>Checks if the remote service allows to re-do the same SSL/TLS handshake (Renegotiation) over an existing / already established SSL/TLS connection.</p> <p>Details: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)</p> <p>OID:1.3.6.1.4.1.25623.1.0.117761</p> <p>Version used: 2024-09-27T05:05:23Z</p>

Medium (CVSS: 4.0)

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Summary

The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).

Quality of Detection (QoD): 80%

Vulnerability Detection Result

Server Temporary Key Size: 1024 bits

Impact

An attacker might be able to decrypt the SSL/TLS communication offline.

Solution:

Solution type: Workaround

- Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group. Please see the references for more resources supporting you with this task.
- For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.

Affected Software/OS

... continues on next page ...

<p>... continued from previous page ...</p> <p>All services providing an encrypted communication using Diffie-Hellman groups with insufficient strength.</p>
<p>Vulnerability Insight The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.</p>
<p>Vulnerability Detection Method Checks the DHE temporary public key size. Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability →.. OID:1.3.6.1.4.1.25623.1.0.106223 Version used: 2025-03-27T05:38:50Z</p>

diffie-hellman-group1-sha1	Using Oakley Group 2 (a 1024-bit MODP group						
	... continues on next page ...						

	... continued from previous page ...
↔) and SHA-1	
Impact An attacker can quickly break individual connections.	
Solution: Solution type: Mitigation Disable the reported weak KEX algorithm(s) - 1024-bit MODP group / prime KEX algorithms: Alternatively use elliptic-curve Diffie-Hellmann in general, e.g. Curve 25519.	
Vulnerability Insight - 1024-bit MODP group / prime KEX algorithms: Millions of HTTPS, SSH, and VPN servers all use the same prime numbers for Diffie-Hellman key exchange. Practitioners believed this was safe as long as new key exchange messages were generated for every connection. However, the first step in the number field sieve—the most efficient algorithm for breaking a Diffie-Hellman connection—is dependent only on this prime. A nation-state can break a 1024-bit prime.	
Vulnerability Detection Method Checks the supported KEX algorithms of the remote SSH server. Currently weak KEX algorithms are defined as the following: - non-elliptic-curve Diffie-Hellmann (DH) KEX algorithms with 1024-bit MODP group / prime - ephemeral key exchange groups uses SHA-1 - using RSA 1024-bit modulus key Details: Weak Key Exchange (KEX) Algorithm(s) Supported (SSH) OID:1.3.6.1.4.1.25623.1.0.150713 Version used: 2024-06-14T05:05:48Z	
Product Detection Result Product: cpe:/a:ietf:secure_shell_protocol Method: SSH Protocol Algorithms Supported OID: 1.3.6.1.4.1.25623.1.0.105565)

Quality of Detection (QoD): 98%	
Vulnerability Detection Result In addition to TLSv1.0+ the service is also providing the deprecated SSLv2 and S →SLv3 protocols and supports one or more ciphers. Those supported ciphers can b →e found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.256 →23.1.0.802067) VT.	
Impact An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection. Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.	
Solution: Solution type: Mitigation It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols. Please see the references for more resources supporting you with this task.	
Affected Software/OS All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.	
Vulnerability Insight The SSLv2 and SSLv3 protocols contain known cryptographic flaws like: - CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE) - CVE-2016-0800: Decrypting RSA with Obsolete and Weakened eNcryption (DROWN)	
Vulnerability Detection Method Checks the used SSL protocols of the services provided by this system. Details: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection OID: 1.3.6.1.4.1.25623.1.0.111012 Version used: 2025-03-27T05:38:50Z	
Product Detection Result Product: cpe:/a:ietf:transport_layer_security:1.0 Method: SSL/TLS: Version Detection OID: 1.3.6.1.4.1.25623.1.0.105782

Medium (CVSS: 5.3)
NVT: SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048 bits

Summary

The remote SSL/TLS server certificate and/or any of the certificates in the certificate chain is using a RSA key with less than 2048 bits.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

The remote SSL/TLS server is using the following certificate(s) with a RSA key with less than 2048 bits (public-key-size:public-key-algorithm:serial:issuer):
1024:RSA:00FAF93A4C7FB6B9CC:1.2.840.113549.1.9.1=#726F6F7440756E74753830342D

→ompliation of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no su
→ch thing outside US,C=XX (Server certificate)

... continues on next page ...

	... continued from previous page ...
Impact	Using certificates with weak RSA key size can lead to unauthorized exposure of sensitive information.
Solution: Solution type: Mitigation	Replace the certificate with a stronger key and reissue the certificates it signed.
Vulnerability Insight	SSL/TLS certificates using RSA keys with less than 2048 bits are considered unsafe.
Vulnerability Detection Method	Checks the RSA keys size of the server certificate and all certificates in chain for a size < 2048 bit. Details: SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048. ↔.. OID:1.3.6.1.4.1.25623.1.0.150710 Version used: 2021-12-10T12:48:00Z

Medium (CVSS: 5.0)
NVT: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)
Summary The remote SSL/TLS service is prone to a denial of service (DoS) vulnerability.
Quality of Detection (QoD): 70%
Vulnerability Detection Result The following indicates that the remote SSL/TLS service is affected: Protocol Version Successful re-done SSL/TLS handshakes (Renegotiation) over an ↔ existing / already established SSL/TLS connection ----- ↔----- TLSv1.0 10
Impact The flaw might make it easier for remote attackers to cause a DoS (CPU consumption) by performing many renegotiations within a single connection.
Solution: Solution type: VendorFix
... continues on next page ...

<p>... continued from previous page ...</p> <p>Users should contact their vendors for specific patch information. A general solution is to remove/disable renegotiation capabilities altogether from/in the affected SSL/TLS service.</p>
<p>Affected Software/OS Every SSL/TLS service which does not properly restrict client-initiated renegotiation.</p>
<p>Vulnerability Insight The flaw exists because the remote SSL/TLS service does not properly restrict client-initiated renegotiation within the SSL and TLS protocols. Note: The referenced CVEs are affecting OpenSSL and Mozilla Network Security Services (NSS) but both are in a DISPUTED state with the following rationale: > It can also be argued that it is the responsibility of server deployments, not a security library, to prevent or limit renegotiation when it is inappropriate within a specific environment. Both CVEs are still kept in this VT as a reference to the origin of this flaw.</p>
<p>Vulnerability Detection Method Checks if the remote service allows to re-do the same SSL/TLS handshake (Renegotiation) over an existing / already established SSL/TLS connection. Details: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094) OID:1.3.6.1.4.1.25623.1.0.117761 Version used: 2024-09-27T05:05:23Z</p>

Solution: Solution type: Mitigation Replace the SSL/TLS certificate by a new one.																																				
Vulnerability Insight This script checks expiry dates of certificates associated with SSL/TLS-enabled services on the target and reports whether any have already expired.																																				
Vulnerability Detection Method ... continues on next page ...																																				

... continued from previous page ...
Details: SSL/TLS: Certificate Expired OID:1.3.6.1.4.1.25623.1.0.103955 Version used: 2024-06-14T05:05:48Z
Product Detection Result Product: cpe:/a:ietf:transport_layer_security Method: SSL/TLS: Collect and Report Certificate Details OID: 1.3.6.1.4.1.25623.1.0.103692)

Medium (CVSS: 5.0) NVT: Check if Mailserver answer to VRFY and EXPN requests
Summary The Mailserver on this host answers to VRFY and/or EXPN requests.
Quality of Detection (QoD): 99%
Vulnerability Detection Result 'VRFY root' produces the following answer: 252 2.0.0 root
Solution: Solution type: Workaround Disable VRFY and/or EXPN on your Mailserver. For postfix add 'disable_vrfy_command=yes' in 'main.cf'. For Sendmail add the option 'O PrivacyOptions=goaway'. It is suggested that, if you really want to publish this type of information, you use a mechanism that legitimate users actually know about, such as Finger or HTTP.
Vulnerability Insight VRFY and EXPN ask the server for information about an address. They are inherently unusable through firewalls, gateways, mail exchangers for part-time hosts, etc.
Vulnerability Detection Method Details: Check if Mailserver answer to VRFY and EXPN requests OID:1.3.6.1.4.1.25623.1.0.100072 Version used: 2023-10-31T05:06:37Z
References url: http://cr.yp.to/smtp/vrfy.html

Medium (CVSS: 4.3) NVT: SSL/TLS: RSA Temporary Key Handling 'RSA_EXPORT' Downgrade Issue (FREAK)
Product detection result cpe:/a:ietf:transport_layer_security Detected by SSL/TLS: Report Supported Cipher Suites (OID: 1.3.6.1.4.1.25623.1.0.→802067)
Summary This host is accepting 'RSA_EXPORT' cipher suites and is prone to a man-in-the-middle (MITM) vulnerability.
Quality of Detection (QoD): 80%
Vulnerability Detection Result 'RSA_EXPORT' cipher suites accepted by this service via the SSLv3 protocol: TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5 TLS_RSA_EXPORT_WITH_RC4_40_MD5 'RSA_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol: TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5 TLS_RSA_EXPORT_WITH_RC4_40_MD5
Impact Successful exploitation will allow remote attacker to downgrade the security of a session to use 'RSA_EXPORT' cipher suites, which are significantly weaker than non-export cipher suites. This may allow a man-in-the-middle attacker to more easily break the encryption and monitor or tamper with the encrypted stream.
Solution: Solution type: VendorFix - Remove support for 'RSA_EXPORT' cipher suites from the service. Please see the references for more resources supporting you with this task. - If the service is using OpenSSL: Update to version 0.9.8zd, 1.0.0p, 1.0.1k or later.
Affected Software/OS - Hosts accepting 'RSA_EXPORT' cipher suites. - OpenSSL versions prior to 0.9.8zd, 1.0.0 prior to 1.0.0p and 1.0.1 prior to 1.0.1k.
Vulnerability Insight ... continues on next page ...

<p>... continued from previous page ...</p> <p>Flaw is due to improper handling RSA temporary keys in a non-export RSA key exchange cipher suite.</p> <p>Vulnerability Detection Method Checks previous collected cipher suites. Medium (CVSS: 4.3)

NVT: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection

Product detection result

cpe:/a:ietf:transport_layer_security:1.0 Detected by SSL/TLS: Version Detection (OID: 1.3.6.1.4.1.25623.1.0.105782)
--

Summary

It was possible to detect the usage of the deprecated TLSv1.0 and/or TLSv1.1 protocol on this system.

Quality of Detection (QoD): 98%
--

Vulnerability Detection Result

The service is only providing the deprecated TLSv1.0 protocol and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report S
--

	... continued from previous page ...
↳supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.802067) VT.	
Impact	An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection. Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.
Solution:	
Solution type: Mitigation	It is recommended to disable the deprecated TLSv1.0 and/or TLSv1.1 protocols in favor of the TLSv1.2+ protocols. Please see the references for more resources supporting you with this task.
Affected Software/OS	<ul style="list-style-type: none"> - All services providing an encrypted communication using the TLSv1.0 and/or TLSv1.1 protocols - CVE-2023-41928: Kiloview P1 4G and P2 4G Video Encoder - CVE-2024-41270: Gorush v1.18.4 - CVE-2025-3200: Multiple products from Wiesemann & Theis
Vulnerability Insight	The TLSv1.0 and TLSv1.1 protocols contain known cryptographic flaws like: <ul style="list-style-type: none"> - CVE-2011-3389: Browser Exploit Against SSL/TLS (BEAST) - CVE-2015-0204: Factoring Attack on RSA-EXPORT Keys Padding Oracle On Downgraded Legacy Encryption (FREAK)
Vulnerability Detection Method	Checks the used TLS protocols of the services provided by this system. Details: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection OID:1.3.6.1.4.1.25623.1.0.117274 Version used: 2025-04-30T05:39:51Z

Medium (CVSS: 4.0)

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability
--

Summary

The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).
--

Quality of Detection (QoD): 80%
--

Vulnerability Detection Result

Server Temporary Key Size: 1024 bits

Impact

An attacker might be able to decrypt the SSL/TLS communication offline.

Solution:

Solution type: Workaround

- | |
|--|
| <ul style="list-style-type: none"> - Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group. Please see the references for more resources supporting you with this task. - For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits. |
|--|

... continues on next page ...

... continued from previous page ...

Affected Software/OS

All services providing an encrypted communication using Diffie-Hellman groups with insufficient strength.

Vulnerability Insight

The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.

Vulnerability Detection Method

Checks the DHE temporary public key size.

Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Medium (CVSS: 4.0)
NVT: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm
Summary
The remote service is using a SSL/TLS certificate in the certificate chain that has been signed using a cryptographically weak hashing algorithm.
Quality of Detection (QoD): 80%
... continues on next page ...

... continued from previous page ...

Vulnerability Detection Result

The following certificates are part of the certificate chain but using insecure signature algorithms:

Subject: 1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D626173
 →652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for Complic
 →ation of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no such thi
 →ng outside US,C=XX
 Signature Algorithm: sha1WithRSAEncryption

Solution:

Solution type: Mitigation

Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.

Vulnerability Insight

The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use:

- Secure Hash Algorithm 1 (SHA-1)
- Message Digest 5 (MD5)
- Message Digest 4 (MD4)
- Message Digest 2 (MD2)

Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates.

NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive:

Fingerprint1

or

fingerprint1, Fingerprint2

Vulnerability Detection Method

Check which hashing algorithm was used to sign the remote SSL/TLS certificate.

Details: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm

Medium (CVSS: 6.1) NVT: jQuery < 1.9.0 XSS Vulnerability
Summary jQuery is prone to a cross-site scripting (XSS) vulnerability.
Quality of Detection (QoD): 80%
Vulnerability Detection Result Installed version: 1.3.2 Fixed version: 1.9.0 Installation path / port: /mutillidae/javascript/ddsmoothmenu/jquery.min.js Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info): - Identified file: http://192.168.186.129/mutillidae/javascript/ddsmoothmenu/jquery.min.js - Referenced at: http://192.168.186.129/mutillidae/
Solution: Solution type: VendorFix Update to version 1.9.0 or later.
Affected Software/OS jQuery prior to version 1.9.0.
Vulnerability Insight The jQuery(strInput) function does not differentiate selectors from HTML in a reliable fashion. In vulnerable versions, jQuery determined whether the input was HTML by looking for the '<' character anywhere in the string, giving attackers more flexibility when attempting to construct a malicious payload. In fixed versions, jQuery only deems the input to be HTML if it explicitly starts with the '<' character, limiting exploitability only to attackers who can control the beginning of a string, which is far less common.
Vulnerability Detection Method Checks if a vulnerable version is present on the target host. Details: jQuery < 1.9.0 XSS Vulnerability OID:1.3.6.1.4.1.25623.1.0.141636 Version used: 2023-07-14T05:06:08Z

Medium (CVSS: 5.8) NVT: HTTP Debugging Methods (TRACE/TRACK) Enabled
Summary The remote web server supports the TRACE and/or TRACK methods. TRACE and TRACK are HTTP methods which are used to debug web server connections.
Quality of Detection (QoD): 99%
Vulnerability Detection Result The web server has the following HTTP methods enabled: TRACE
Impact An attacker may use this flaw to trick your legitimate web users to give him their credentials.
Solution: Solution type: Mitigation Disable the TRACE and TRACK methods in your web server configuration. Please see the manual of your web server or the references for more information.
Affected Software/OS Web servers with enabled TRACE and/or TRACK methods.
Vulnerability Insight It has been shown that web servers supporting this methods are subject to cross-site-scripting attacks, dubbed XST for Cross-Site-Tracing, when used in conjunction with various weaknesses in browsers.
Vulnerability Detection Method Checks if HTTP methods such as TRACE and TRACK are enabled and can be used. Details: HTTP Debugging Methods (TRACE/TRACK) Enabled OID:1.3.6.1.4.1.25623.1.0.11213 Version used: 2023-08-01T13:29:10Z

Medium (CVSS: 5.0)
NVT: awiki <= 20100125 Multiple LFI Vulnerabilities - Active Check
Summary awiki is prone to multiple local file include (LFI) vulnerabilities because it fails to properly sanitize user-supplied input.
Quality of Detection (QoD): 99%
Vulnerability Detection Result Vulnerable URL: http://192.168.186.129/mutillidae/index.php?page=/etc/passwd
Impact ... continues on next page ...

... continued from previous page ...
An attacker can exploit this vulnerability to obtain potentially sensitive information and execute arbitrary local scripts in the context of the webserver process. This may allow the attacker to compromise the application and the host.
Solution: Solution type: WillNotFix No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.
Affected Software/OS awiki version 20100125 and prior.
Vulnerability Detection Method Sends a crafted HTTP GET request and checks the response. Details: awiki <= 20100125 Multiple LFI Vulnerabilities - Active Check OID:1.3.6.1.4.1.25623.1.0.103210 Version used: 2025-04-15T05:54:49Z
References url: https://www.exploit-db.com/exploits/36047/ url: http://www.securityfocus.com/bid/49187

Medium (CVSS: 5.0)
NVT: /doc directory browsable
Summary The /doc directory is browsable. /doc shows the content of the /usr/doc directory and therefore it shows which programs and - important! - the version of the installed programs.
Quality of Detection (QoD): 80%
Vulnerability Detection Result Vulnerable URL: http://192.168.186.129/doc/
Solution: Solution type: Mitigation Use access restrictions for the /doc directory. If you use Apache you might use this in your access.conf: <Directory /usr/doc> AllowOverride None order deny,allow deny from all allow from localhost</Directory>
Vulnerability Detection Method ... continues on next page ...

... continued from previous page ...
Details: /doc directory browsable OID:1.3.6.1.4.1.25623.1.0.10056 Version used: 2023-08-01T13:29:10Z
References cve: CVE-1999-0678 url: http://www.securityfocus.com/bid/318

Medium (CVSS: 4.8)
NVT: Cleartext Transmission of Sensitive Information via HTTP
Summary The host / application transmits sensitive information (username, passwords) in cleartext via HTTP.
Quality of Detection (QoD): 80%
Vulnerability Detection Result The following input fields were identified (URL:input name): <code>http://192.168.186.129/dvwa/login.php:password</code> <code>http://192.168.186.129/phpMyAdmin/:pma_password</code> <code>http://192.168.186.129/phpMyAdmin/?D=A:pma_password</code> <code>http://192.168.186.129/tikiwiki/tiki-install.php:pass</code> <code>http://192.168.186.129/twiki/bin/view/TWiki/TWikiUserAuthentication:oldpassword</code>
Impact An attacker could use this situation to compromise or eavesdrop on the HTTP communication between the client and the server using a man-in-the-middle attack to get access to sensitive data like usernames or passwords.
Solution: Solution type: Workaround Enforce the transmission of sensitive data via an encrypted SSL/TLS connection. Additionally make sure the host / application is redirecting all users to the secured SSL/TLS connection before allowing to input sensitive data into the mentioned functions.
Affected Software/OS Hosts / applications which doesn't enforce the transmission of sensitive data via an encrypted SSL/TLS connection.
Vulnerability Detection Method Evaluate previous collected information and check if the host / application is not enforcing the transmission of sensitive data via an encrypted SSL/TLS connection. The script is currently checking the following: ... continues on next page ...

Medium (CVSS: 4.3)

NVT: jQuery < 1.6.3 XSS Vulnerability

Summary

jQuery is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

Installed version: 1.3.2

Fixed version: 1.6.3

Installation

path / port: /mutillidae/javascript/ddsmoothmenu/jquery.min.js
 Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
 - Identified file: <http://192.168.186.129/mutillidae/javascript/ddsmoothmenu/jquery.min.js>
 - Referenced at: <http://192.168.186.129/mutillidae/>

Solution:

Solution type: VendorFix

Update to version 1.6.3 or later.

Affected Software/OS

jQuery prior to version 1.6.3.

Vulnerability Insight

Cross-site scripting (XSS) vulnerability in jQuery before 1.6.3, when using location.hash to select elements, allows remote attackers to inject arbitrary web script or HTML via a crafted tag.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: **jQuery < 1.6.3 XSS Vulnerability**

Medium (CVSS: 4.3) NVT: Apache HTTP Server 'httpOnly' Cookie Information Disclosure Vulnerability
Product detection result cpe:/a:apache:http_server:2.2.8 Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1 → .0.117232)
Summary Apache HTTP Server is prone to a cookie information disclosure vulnerability.
Quality of Detection (QoD): 99%
Vulnerability Detection Result Vulnerability was detected according to the Vulnerability Detection Method.
Impact Successful exploitation will allow attackers to obtain sensitive information that may aid in further attacks.
Solution: Solution type: VendorFix Update to Apache HTTP Server version 2.2.22 or later.
Affected Software/OS Apache HTTP Server versions 2.2.0 through 2.2.21.
Vulnerability Insight The flaw is due to an error within the default error response for status code 400 when no custom ErrorDocument is configured, which can be exploited to expose 'httpOnly' cookies.
Vulnerability Detection Method Details: Apache HTTP Server 'httpOnly' Cookie Information Disclosure Vulnerability OID:1.3.6.1.4.1.25623.1.0.902830

[[return to 192.168.186.129](#)]

2.1.32 Low general/icmp

Low (CVSS: 2.1)

NVT: ICMP Timestamp Reply Information Disclosure

Summary

The remote host responded to an ICMP timestamp request.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

... continues on next page ...

... continued from previous page ...
The following response / ICMP packet has been received: - ICMP Type: 14 - ICMP Code: 0
Impact This information could theoretically be used to exploit weak time-based random number generators in other services.
Solution: Solution type: Mitigation Various mitigations are possible: - Disable the support for ICMP timestamp on the remote host completely - Protect the remote host by a firewall, and block ICMP packets passing through the firewall in either direction (either completely or only for untrusted networks)
Vulnerability Insight The Timestamp Reply is an ICMP message which replies to a Timestamp message. It consists of the originating timestamp sent by the sender of the Timestamp as well as a receive timestamp and a transmit timestamp.
Vulnerability Detection Method Sends an ICMP Timestamp (Type 13) request and checks if a Timestamp Reply (Type 14) is received. Details: ICMP Timestamp Reply Information Disclosure OID:1.3.6.1.4.1.25623.1.0.103190 Version used: 2025-01-21T05:37:33Z
References cve: CVE-1999-0524 url: https://datatracker.ietf.org/doc/html/rfc792 url: https://datatracker.ietf.org/doc/html/rfc2780 cert-bund: CB-K15/1514 cert-bund: CB-K14/0632 dfn-cert: DFN-CERT-2014-0658

[[return to 192.168.186.129](#)]

2.1.33 Low general/tcp

Low (CVSS: 2.6)
NVT: TCP Timestamps Information Disclosure
Summary
... continues on next page ...

... continued from previous page ...
The remote host implements TCP timestamps and therefore allows to compute the uptime.
Quality of Detection (QoD): 80%
Vulnerability Detection Result It was detected that the host implements RFC1323/RFC7323. The following timestamps were retrieved with a delay of 1 seconds in-between: Packet 1: 2178212 Packet 2: 2178321
Impact A side effect of this feature is that the uptime of the remote host can sometimes be computed.
Solution: Solution type: Mitigation To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime. To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled'. Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled. The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment. See the references for more information.
Affected Software/OS TCP implementations that implement RFC1323/RFC7323.
Vulnerability Insight The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.
Vulnerability Detection Method Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported. Details: TCP Timestamps Information Disclosure OID:1.3.6.1.4.1.25623.1.0.80091 Version used: 2023-12-15T16:10:08Z

2.1.34 Low 22/tcp

Low (CVSS: 2.6) NVT: Weak MAC Algorithm(s) Supported (SSH)
Product detection result cpe:/a:ietf:secure_shell_protocol Detected by SSH Protocol Algorithms Supported (OID: 1.3.6.1.4.1.25623.1.0.105565 ↔)
Summary The remote SSH server is configured to allow / support weak MAC algorithm(s).
Quality of Detection (QoD): 80%
Vulnerability Detection Result The remote SSH server supports the following weak client-to-server MAC algorithm ↔(s): hmac-md5 hmac-md5-96 hmac-sha1-96 umac-64@openssh.com The remote SSH server supports the following weak server-to-client MAC algorithm ↔(s): hmac-md5 hmac-md5-96 hmac-sha1-96 umac-64@openssh.com
Solution: Solution type: Mitigation Disable the reported weak MAC algorithm(s).
Vulnerability Detection Method Checks the supported MAC algorithms (client-to-server and server-to-client) of the remote SSH server. Currently weak MAC algorithms are defined as the following: - MD5 based algorithms - 96-bit based algorithms - 64-bit based algorithms - 'none' algorithm Details: Weak MAC Algorithm(s) Supported (SSH) OID:1.3.6.1.4.1.25623.1.0.105610 Version used: 2024-06-14T05:05:48Z

2.1.35 Low 25/tcp

Low (CVSS: 3.7)

NVT: SSL/TLS: 'DHE_EXPORT' MITM Security Bypass Vulnerability (LogJam)

Product detection result

cpe:/a:ietf:transport_layer_security
Detected by SSL/TLS: Report Supported Cipher Suites (OID: 1.3.6.1.4.1.25623.1.0.→802067)

Summary

This host is accepting 'DHE_EXPORT' cipher suites and is prone to a man-in-the-middle (MITM) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

'DHE_EXPORT' cipher suites accepted by this service via the SSLv3 protocol:
TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA
TLS_DH_anon_EXPORT_WITH_RC4_40_MD5
'DHE_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol:
TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA
TLS_DH_anon_EXPORT_WITH_RC4_40_MD5

Impact

Successful exploitation will allow a man-in-the-middle attacker to downgrade the security of a TLS session to 512-bit export-grade cryptography, which is significantly weaker, allowing the attacker to more easily break the encryption and monitor or tamper with the encrypted stream.

... continues on next page ...

... continued from previous page ...

Solution:**Solution type:** VendorFix

- Remove support for 'DHE_EXPORT' cipher suites from the service. Please see the references for more resources supporting you with this task.
- If the service is using OpenSSL: Update to version 1.0.1n, 1.0.2b or later.

Affected Software/OS

- Hosts accepting 'DHE_EXPORT' cipher suites.
- OpenSSL versions prior to 1.0.1n and 1.0.2 prior to 1.0.2b.

Vulnerability Insight

Flaw is triggered when handling Diffie-Hellman key exchanges defined in the 'DHE_EXPORT' cipher suites.

Vulnerability Detection Method

Checks previous collected cipher suites.

Details: SSL/TLS: 'DHE_EXPORT' MITM Security Bypass Vulnerability (LogJam)

Product detection result

cpe:/a:ietf:transport_layer_security

Detected by SSL/TLS: Report Supported Cipher Suites (OID: 1.3.6.1.4.1.25623.1.0.→802067)

Summary

This host is prone to an information disclosure vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

Vulnerability was detected according to the Vulnerability Detection Method.

... continues on next page ...

	... continued from previous page ...
Impact Successful exploitation will allow a man-in-the-middle attackers gain access to the plain text data stream.	
Solution: Solution type: Mitigation Possible Mitigations are: - Disable SSLv3 - Disable cipher suites supporting CBC cipher modes - Enable TLS_FALLBACK_SCSV if the service is providing TLSv1.0+	
Vulnerability Insight The flaw is due to the block cipher padding not being deterministic and not covered by the Message Authentication Code	
Vulnerability Detection Method Evaluate previous collected information about this service. Details: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability . →.. OID:1.3.6.1.4.1.25623.1.0.802087 Version used: 2024-09-30T08:38:05Z

2.2.2 Medium 3389/tcp

Medium (CVSS: 4.3)
NVT: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection
... continues on next page ...

	... continued from previous page ...
Product detection result cpe:/a:ietf:transport_layer_security:1.0 Detected by SSL/TLS: Version Detection (OID: 1.3.6.1.4.1.25623.1.0.105782)	
Summary It was possible to detect the usage of the deprecated TLSv1.0 and/or TLSv1.1 protocol on this system.	
Quality of Detection (QoD): 98%	
Vulnerability Detection Result In addition to TLSv1.2+ the service is also providing the deprecated TLSv1.0 and → TLSv1.1 protocols and supports one or more ciphers. Those supported ciphers c →an be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1 →.25623.1.0.802067) VT.	
Impact An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection. Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.	
Solution: Solution type: Mitigation It is recommended to disable the deprecated TLSv1.0 and/or TLSv1.1 protocols in favor of the TLSv1.2+ protocols. Please see the references for more resources supporting you with this task.	
Affected Software/OS - All services providing an encrypted communication using the TLSv1.0 and/or TLSv1.1 protocols - CVE-2023-41928: Kiloview P1 4G and P2 4G Video Encoder - CVE-2024-41270: Gorush v1.18.4 - CVE-2025-3200: Multiple products from Wiesemann & Theis	
Vulnerability Insight The TLSv1.0 and TLSv1.1 protocols contain known cryptographic flaws like: - CVE-2011-3389: Browser Exploit Against SSL/TLS (BEAST) - CVE-2015-0204: Factoring Attack on RSA-EXPORT Keys Padding Oracle On Downgraded Legacy Encryption (FREAK)	
Vulnerability Detection Method Checks the used TLS protocols of the services provided by this system. Details: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection OID: 1.3.6.1.4.1.25623.1.0.117274	
... continues on next page ...

2.2.3 Low general/tcp

Low (CVSS: 2.6)
NVT: TCP Timestamps Information Disclosure
Summary The remote host implements TCP timestamps and therefore allows to compute the uptime.
Quality of Detection (QoD): 80%
Vulnerability Detection Result It was detected that the host implements RFC1323/RFC7323. The following timestamps were retrieved with a delay of 1 seconds in-between: Packet 1: 73460670 Packet 2: 73461779
Impact A side effect of this feature is that the uptime of the remote host can sometimes be computed.
Solution: Solution type: Mitigation To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime. To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled'. Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled. The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment. See the references for more information.
Affected Software/OS TCP implementations that implement RFC1323/RFC7323.
Vulnerability Insight The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.
Vulnerability Detection Method Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported. Details: TCP Timestamps Information Disclosure OID:1.3.6.1.4.1.25623.1.0.80091 Version used: 2023-12-15T16:10:08Z

2.3.1 Medium 8080/tcp

Medium (CVSS: 4.8)

NVT: Cleartext Transmission of Sensitive Information via HTTP

Summary

The host / application transmits sensitive information (username, passwords) in cleartext via HTTP.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

The following input fields were identified (URL:input name):
http://192.168.186.128:8080/login:j_password

Impact

An attacker could use this situation to compromise or eavesdrop on the HTTP communication between the client and the server using a man-in-the-middle attack to get access to sensitive data like usernames or passwords.

Solution:

Solution type: Workaround

Enforce the transmission of sensitive data via an encrypted SSL/TLS connection. Additionally make sure the host / application is redirecting all users to the secured SSL/TLS connection before allowing to input sensitive data into the mentioned functions.

Affected Software/OS

Hosts / applications which doesn't enforce the transmission of sensitive data via an encrypted SSL/TLS connection.

... continues on next page ...

... continued from previous page ...

Vulnerability Detection Method

Evaluate previous collected information and check if the host / application is not enforcing the transmission of sensitive data via an encrypted SSL/TLS connection.

The script is currently checking the following:

- HTTP Basic Authentication (Basic Auth)
- HTTP Forms (e.g. Login) with input field of type 'password'

Details: Cleartext Transmission of Sensitive Information via HTTP

2.4.2 Low general/icmp

Low (CVSS: 2.1)
NVT: ICMP Timestamp Reply Information Disclosure
Summary The remote host responded to an ICMP timestamp request.
Quality of Detection (QoD): 80%
... continues on next page ...

	... continued from previous page ...
Vulnerability Detection Result The following response / ICMP packet has been received: - ICMP Type: 14 - ICMP Code: 0	
Impact This information could theoretically be used to exploit weak time-based random number generators in other services.	
Solution: Solution type: Mitigation Various mitigations are possible: - Disable the support for ICMP timestamp on the remote host completely - Protect the remote host by a firewall, and block ICMP packets passing through the firewall in either direction (either completely or only for untrusted networks)	
Vulnerability Insight The Timestamp Reply is an ICMP message which replies to a Timestamp message. It consists of the originating timestamp sent by the sender of the Timestamp as well as a receive timestamp and a transmit timestamp.	
Vulnerability Detection Method Sends an ICMP Timestamp (Type 13) request and checks if a Timestamp Reply (Type 14) is received. Details: ICMP Timestamp Reply Information Disclosure OID:1.3.6.1.4.1.25623.1.0.103190 Version used: 2025-01-21T05:37:33Z

2.4.3 Low general/tcp

Low (CVSS: 2.6) NVT: TCP Timestamps Information Disclosure
... continues on next page ...

	... continued from previous page ...
Summary	The remote host implements TCP timestamps and therefore allows to compute the uptime.
Quality of Detection (QoD): 80%	
Vulnerability Detection Result	<p>It was detected that the host implements RFC1323/RFC7323.</p> <p>The following timestamps were retrieved with a delay of 1 seconds in-between:</p> <p>Packet 1: 6643590 Packet 2: 6644685</p>
Impact	A side effect of this feature is that the uptime of the remote host can sometimes be computed.
Solution:	
Solution type: Mitigation	<p>To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime.</p> <p>To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled'. Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled. The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment.</p> <p>See the references for more information.</p>
Affected Software/OS	TCP implementations that implement RFC1323/RFC7323.
Vulnerability Insight	The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.
Vulnerability Detection Method	<p>Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported.</p> <p>Details: TCP Timestamps Information Disclosure OID:1.3.6.1.4.1.25623.1.0.80091 Version used: 2023-12-15T16:10:08Z</p>
